# Process Mining in the performance management of the clinic

Process Mining provides complete transparency and objectivity by using "real" process data.

Digital "Footprint"

Nowadays tasks and processes are increasingly supported by IT systems. Every event leaves a digital footprint that can be measured. Measurability creates objectivity and reliable results.

Complete and efficient

The measured events and their specific characteristics (time, ID, age, treatment) are transferred into a comprehensible and complete process image. The navigation focuses on the essentials.

Transparent und objective

The transparent visualization of process variants allows the analysis of distributions, frequencies and specific characteristics via simple functions. The actual reason for process breaks is revealed.

Monitoring and performance

Once interfaces have been set up, they can be used in a continuous monitoring process. Improvements and effects of measures become transparent and scalable.
